## LOW DOSE CT SCAN OF THORAX

### Clinical data:

CA cervix with lung metastases.

### Technique:

One AP scout. 5mm thick slices at 5mm intervals through the thorax using low dose technique.

### Findings:

Comparison is made with previous examination in August 2004.

Multiple soft tissue density masses are present at both of lungs consistent with multiple pulmonary metastases. The largest lesion is present at left upper lobe. It measures 2.5 x 2.4 cm. This is larger than previous examination which measures 2.2 cm in diameter.

The largest lesion in right lung is noted at right lower lobe. It measures 1.6 cm in diameter. This is larger than previous examination which measures 1.4 x 1.1 cm.

The other pulmonary nodule has interval increased size.

No active infiltrates or effusion is present.

No obvious hilar or mediastinal adenopathy is noted.

### Impression:

Carcinoma of cervix with multiple pulmonary metastases, the size of lesion has increased.
